

Day #1: Docker

Q: How do I deploy Docker containers with Kubernetes via CircleCI to AWS or other type of hosting platform.

A: Let's remember the basics first..

You want decoupling of containers (e.g. node app - one container, redis - another one) because having all in one may make problems when scaled (e.g. two instances of the same node♥redis container will often result to the different redis values per container on node app) (e.g. node app that collects numbers of visits to redis)
